TREATMENT OF THE OAB IS THERE A RIGHT DRUG THERAPY FOR TREATING FEMALE OAB?

MAURIZIO SERATI

MODERATOR: STAVROS ATHANASIOU

24 MAY 2022 | 18.30-19.15 CEST

RATIONALE: Overactive bladder is a multifactorial and complex syndrome with several possible pathophysiological mechanisms involved. There are many possible treatments, such as behavioral interventions, pelvic floor muscle training, bladder training, and pharmacological therapies. Unfortunately, few studies are available, that have compared the different treatments or drugs used to treat women with OAB. However, many patients with OAB drop out of treatment after a few weeks. Therefore, the treatment of OAB is still a challenge, but only if we are able to understand the pathophysiology of each phenotype and of each patient with OAB, we will improve the outcomes of our treatment of this syndrome
